

WEBSITE LAUNCH PLAN

Cloudflare + Supabase Approval Brief

Prepared for Nat and Hunter

This brief explains the proposed monthly platform spend, what it buys for Urblo, and the practical steps needed to get the website live in a way that is easier to maintain after launch.

Decision requested

Approve the Cloudflare + Supabase launch direction and the expected monthly operating budget.

Expected monthly cost

Approx. USD 30/month for lean production, or USD 50/month with paid email headroom.

Why this change matters

The current website is close to a static, code-managed site. That is fine for a first version, but it makes three important launch needs harder: reliable form capture, easy content updates, and controlled media performance.

The proposed setup turns the site into a more practical business asset: the public website stays fast, enquiries are stored properly, and Urblo can update Projects, Stone Library and Articles through an admin area instead of asking a developer to change code for every update.

What Nat and Hunter get from the monthly spend

- A production hosting setup through Cloudflare, including preview links before changes go live.
- Real Contact and Sample Request submissions that are saved, searchable and emailed to the right people.
- A private admin area for maintaining Projects, Stone Library records, Articles, media and lead status.
- Less dependency on old website media URLs, which helps page speed and reduces launch risk.
- A cleaner handoff model: future updates become content or feature work, not repeated emergency fixes.

MONTHLY COSTS

Recommended operating budget

Most platform pricing is in USD. The AUD estimates use a planning rate of roughly 1 USD = 1.4 AUD. Actual invoices can change with exchange rate, tax and usage.

Item	Purpose	USD / month	AUD / month
Cloudflare Pages	Hosts the public website and preview deployments.	0	0
Cloudflare Workers / Pages Functions	Handles form APIs and future small backend tasks.	5	7
Cloudflare Turnstile	Protects public forms from spam without traditional CAPTCHA friction.	0	0
Supabase Pro	Database, login, storage, daily backups and production reliability.	25	35
Resend email	Sends enquiry and sample-request notifications.	0 to 20	0 to 28
Cloudflare R2 media reserve	Optional controlled storage for larger media, especially if video traffic grows.	0 to 2 early	0 to 3 early

Lean production

Approx. USD 30/month, or about AUD 42/month. This covers Cloudflare Workers Paid and Supabase Pro, while using the free email tier at first.

Safer production

Approx. USD 50/month, or about AUD 70/month. This adds paid email headroom so form notifications are less constrained.

The recommendation is to launch lean if enquiry volume is modest, then move email to the paid plan when daily limits or deliverability confidence become more important.

PRACTICAL WORK

What will be built next

The purpose of the work is to get the website live sooner without creating a maintenance burden. The build sequence below keeps the client-facing outcome clear at each step.

1. Launch foundation

Set up Cloudflare Pages, preview deployments, production settings and a rollback path.

2. Supabase content base

Create the database structure for Projects, Stone Library, Articles, media and lead records.

3. Real forms

Replace email-draft behaviour with Contact and Sample Request submissions that save to Supabase and send notifications.

4. Admin area

Give Urblo a private place to create, edit, publish and archive content without code changes.

5. Media cleanup

Move priority images and homepage video away from old website URLs and set a safer mobile fallback.

6. Final QA and launch

Check mobile pages, forms, SEO metadata, social previews, claims wording, DNS cutover and rollback.

BUSINESS OUTCOME

Problems this solves

No lost enquiries

Contact and sample requests are recorded in a database, not only sent through a visitor's email client.

Content can keep moving

New projects, stone records and articles can be added through admin instead of waiting for a code change.

Cleaner launch risk

Preview deployments and rollback make it easier to review changes before the public site is affected.

Better customer confidence

Faster media, cleaner metadata, working forms and accurate claims make the site feel more trustworthy.

Lower long-term maintenance pressure

After launch, the work can shift to occasional upkeep and new features rather than repeated content edits.

What is not being overcomplicated

- This is not a large custom software platform. It is a practical website backend and admin layer.
- The public site can remain fast and mostly static while the content and forms are managed properly behind it.
- Advanced features can come later, after the launch foundation is stable.

DECISIONS NEEDED

What Nat and Hunter need to confirm

- Approve Cloudflare + Supabase as the launch direction.
- Approve the expected platform budget: about USD 30/month lean, or about USD 50/month with paid email headroom.
- Confirm who should receive Contact and Sample Request notifications.
- Confirm who will have admin access after launch.
- Confirm who signs off project facts, stone details and carbon/performance claims before publishing.
- Confirm whether to start with free email quota or move straight to paid email for a more conservative production setup.

Recommended approval

Approve the Cloudflare + Supabase setup and begin with the lean production budget. Move transactional email to the paid plan when enquiry volume, notification reliability or brand confidence justifies it.
